No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                Vascular development; mitogen; blood vessel, vascular endothelial growth factor; neovascu
                                                                                                                                                                                                                                                                                                                                                                                   Sequence of vascular endothelial cell growth factor VEGF 146\, amino acid residue subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Multiple cDNAs encoding alternative forms of the VEGF A-subunit were amplified using PCR primers as in Q23049 and Q23050. Three sets of clones were identified. Clone #12 encoded the 164 amino acid secreted form of VEGF A-subunit (see R2347), Clone #14 has a 135 bp 72bp insertion and thus encodes a 120 amino acid form and Clone #16 has a 72bp insertion and encodes a 188 amino acid mature protein (R22351), and the third base of the Arg184 codon. The 120 amino acid mature protein has Asn140 converted to Lys140.
                                                                                                                                                                                                                                                                                                                                                                                                                              25-FEB-1993
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R27354 standard; Protein; 146

        The present sequence represents a rat vascular endothelial growth factor II (VEGF II) A subunit variant with a conversion of Asn 140 to Lys 140, w35639. The present invention describes: (1) a mammalian VEGF II protein from W35639 or the first 115-135 amino acids of W3538; and 2) and a B subunit a mammalian VEGF II protein a mammalian VEGF comprising a heterodimer or homodimer of B subunit a mammalian VEGF comprising a heterodimer or homodimer of B subunits. and for promoting tissue repair.

N.B. The present sequence is not given inthe specification but is derived from Fig 5 as stated in the claim.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cys-Lys-Asn-Thr-Asp from polypeptide T38 (residues 164-168) were used to PCR amplify the central region of the cDNA for VBGF A chain. A single band migrating at 420 bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained (p4338) was used to design antisense and sense PCR primers to amplify the 5' and 3' ends of the cDNA. These 5' and 3' clones are denoted p5-15 and pw3, respectively. In addition to the cDNA coding the 164 amino acid secreted form identified by protein sequencing, two alternatively spliced cDNAs encoding a 146 amino acid forms are cloned and sequenced.

The invention relates to a purified and isolated VEGF C subunit amino acid sequence Y57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or BC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VEGF; vascular endothelial growth factor; A subunit; tissue growth; vascular development; artificial blood vessel; repair; human.

                                                                                                                                                                                                                                                                                                                                                                                                                         the protein in circulation, whereas hbbGF165 binds heparin strongly. The product can be used for angiogenesis and re-endothellalisation of inner vascular surfaces in wound healing, e.g. treatment of full-thickness wounds such as dermal ulcers, venous ulcers and diabetic ulcers, burns, in surgery, in balloon angioplasty and for the in vitro culturing of endothelial cells. Hybrid growth factors of PDGF and VEGF can exhibit a mitogenic profile between each factor and can be used for wound healing or as inhibitors of angiogenesis for e.g. preventing the growth of tumours.

VEGF analogues in which CVS residues are substd. are more stable. see also Q10791-93; Q10796-97; Q10806-08 and Q11099.
                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The two forms of VEFG (Q10797 and Q10917) which arise through different message splicing, have different properties. In partic. hVEGF121 does not bind to heparin leaving more of the protein free to bind to VEGF receptor and increase the half-life and distribution of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding vascular endothelial cell growth factor - used for producing the factor for anglogenesis and re-endothelialisation

                                                                                                                                                                                                                                                                                                                    The sequence of Q44260 contains an open reading frame corresponding to the 165 amino acid human vascular endothelial cell growth factor (hVEGF-165, see R38921). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hVEGF (see R42607). The full-length coding sequences can be generated using PCR with human foetal vascular smooth muscle

   This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 26 (1989) 2956). Y08278-Y08301 are human growth factor protein fragments used in the method of the invention.

The specification describes a monoclonal antibody which is specific to VEGF 121, and a hybridoma producing this antibody. The antibody is used in a method for measuring the amount of VEGF 121 present in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                       This invention describes a novel polypeptide that is a parapox virus homolog of human vascular endothelial growth factor (PPV-VEGF) and stimulates endothelial cell proliferation. The products of the invention have angiogenic activity. The polypeptide can be used in pharmaceutical compositions for therapeutic or diagnostic use, e.g. for stimulating angiogenesis or tissue repair or for immunomodulation, e.g. by stimulating endothelial cell proliferation or inhibiting dendritic cell differentiation. Nucleic acids encoding the polypeptide can be used in pharmaceutical compositions for DNA vaccination or gene therapy. This sequence represents a protein fragment of a parapox virus D1701 vascular endothelial growth factor (VEGF) homologue.

                                                                                                                                              CC R91075-R91078 are human vascular endothelial growth factors (VEGFS).

CD DNA encoding a VEGF can be used to create a fusion protein (FP),

CC the cDNA of which includes a nucleic acid binding domain (NABD) and

CC encodes a heparin binding growth factor, HepGF (e.g. VEGF, FGF, HBEGF),

CC a protein synthesis inhibitor and opt. a linker imparting flexibility

CC to the FP. The FP can be used to target a protein synthesis inhibitor;

CC an antisense DNA sequence or an inhibitor of elongation factor 2, to a

CC cell carrying a HepGF receptor. The conjugates of the invention are

CC used to inhibit cell proliferation in cells carrying the particular

CC growth factor receptor. A specific application is to prevent

CC excessive proliferation of epithelial cells, fibroblasts and

CC excessive proliferation of epithelial cells, fibroblasts and

CC trabeculectomy after glaucoma surgery and corneal clouding after

CC excimer laser treatment. Other conditions which may be treated include

CC complications, Kaposi's sarcoma and rheumatoid arthritis.

                                                                                                                                                         R94001-R94004, R94031, R94032, R94039 and R94040 represent vascular cendothelial growth factors (VEGF). This sequence represents VEGF121. These sequences were used in VEGF conjugates of the invention. In the conjugates, VEGF (or fragments of it) are linked to a targeted agent (this can be via a linker sequence), so that the conjugate binds to a VEGF receptor. Cys-modified forms of VEGF are particularly suitable for chemical conjugation to linkers and targeted agents. The conjugates are used for inhibiting proliferation of cells bearing VEGF receptors. They can be used for treating a VEGF-mediated pathophysiological condition, including dermatological disorders with underlying vascular proliferation, solid tumours or an ophthalmic disorder of hyperproliferating blood vessels of the retina, iris, conjunctiva or vitreous humour. The conjugates can also be used for treating psoriasis, rheumatoid arthritis, skin cancers and other tumours, or varicose veins. They are also suitable for use in gene therapy.
                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents human vascular endothelial growth fact (VEGF-121). VEGF stimulates production of nitric oxide and prostacyclin. VEGF can therefore be used for treatment or prevention of intimal hyperplasia in a blood vessel. VEGF can be used for treatment or preventing any condition responsive to in vivo stimulation of nitric acid and prostacyclin (especially essential hypertension, pulmonary arterial hypertension (PAH), cor pulmonale and atherosclerosis: VEGF is specifically used to control (re)stenosis, where caused by PAH or by a surgical procedure such as angioplasty, coronary bypass operation, anastomosis or endarteriectomy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-AUG-1997;

compliferating cells. The gene delivery composition comprises a protein chat binds the fibroblast growth factor receptor (FGFR) which is fused or chemically conjugated to a nucleic acid binding domain. The nucleic acid binding domain is complexed with a suitable expression construct encoding a cytotoxin such as saporin. One or more linkers may join the case the conding protein to the nucleic acid binding protein. These are selected to increase the specificity, toxicity, solubility, serum construct condensation of nucleic acids for delivery to a cell. The fusion protein condensation of nucleic acids for delivery to a cell. The fusion protein condensation of nucleic acids for the therapeutic alteration of the function, gene expression and viability of cells. In particular, it may be used for the treatment and prevention of cell proliferative disorders, for example after eye surgery, melanoma and many other sorts of cancer. Crimumatoid arthritis, restenosis, Duptyrren's contracture, diabetic retinopathy, psoriasis and eczema. The gene delivery compositions of the invention have high specificity for particular cells and can deliver are proteins. Al2857 represent cDNA compared to prior art methods. Sequences Al2853-CAL2855 represent cDNA compared to prior art methods. Sequences Al2853-CAL2855 proteins. Al2857 represents cDNA encoding human heparin-binding cepidermal growth factor (HBEGF) procursor, and y90406-y90409 represent cCC.

The present sequence represents native human vascular endothelial growth CC factor (VEGF) 121. VEGF is an angiogenic factor. VEGF proteins are used compared to the prevention or repair of injury to blood vessels or associated compared repair of vascular itssues (served by the blood vessels) and for the prevention and repair of vascular injury associated with microvascular angiopathy. CC particularly thrombotic microangiopathy. The proteins methods may also be used for the prevention and treatment of kidney diseases associated compared to the prevention and treatment of the glomerulus and compared to the conditions which may be treated include haemolytic uremic syndrome. To conditions which may be treated include haemolytic uremic compared to the states, platelet activation or aggregation, thrombosis, compressed to transcellar coagulation, sepsis, pancreatis, acute renal failure, conditional infarction, ischemic bowel disease, transient ischemic conditional infarction, acute respiratory distress syndrome to the calvoolar conditions in the conditional conditions. The conditional conditions are syndrome to the calvoolar conditions in the conditions and the conditions are syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09-SEP-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Multiple cDNAs encoding alternative forms of the VEGF A-subunit were amplified using PCR primers as in Q23049 and Q23050. Three sets of clones were identified. Clone #12 encoded the 164 amino acid deletion and thus encodes a 120 amino acid form and Clone #16 has a 135 bp 72bp insertion and encodes a 120 amino acid form and Clone #16 has a The deleted region lies between the second base of the Asn140 codon protein has Asn140 converted to Lys140.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             135

    The present sequence represents a rat vascular endothelial growth factor II (VEGF II) A subunit variant with a conversion of Asn 140 to Lys 140, was the deletion of His 141 to Arg 184 from the wild-type given in comprising an A subunit from w33639. The present invention describes: (1) a mammalian VEGF II protein from w33639, w33639 or the first 115-135 amino acids of w33638; and a B subunit a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair N.B. The present sequence is not given inthe specification but is derived from Fig 5 as stated in the claim.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor II A subunit variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cys-Lys-Asn-Thr-Asp from polypeptide T38 (residues 164-168) were used to PCR amplify the central region of the cDNA for VEGF A chain. A single band migrating at 420 bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence coatained (p438) was used to design antisense and sense PCR primers are denoted p5-15 and pw3, respectively. In addition to the cDNA coding the 164 amino acid secreted form identified by protein sequencing, two alternatively spliced cDNAs encoding a 146 amino acid and a 214 amino acid forms are cloned and sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-JUL-1998

                                                                                                                                                                        This is the amino acid sequence of a 146 amino acid residue A subunit of vascular endothelial cell growth factor (VEGF). The invention relates to a purified and isolated VEGF C subunit amino acid sequence Y57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or EC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair.

In partic. CC hyEGF121 does not bind to heparin leaving more of the protein free to the protein in circulation, whereas hBEGF165 binds haparin strongly. CC of inner vascular surfaces in wound healing, e.g. treatment of full-CC unlers, burns, in surgery, in balloon angioplasty and for the in CC vitro culturing of endothelial cells. HyDrid growth factors of PDGF can be used for wound really profile between each factor and CC end vege can exhibit a mitogenic profile between each factor and CC e.g. preventing the growth of tumours.

CC VEGF analogues in which CXS residues are substd. are more stable. XXX

                      The present sequence represents vascular endothelial growth factor (VEGF) 121. The specification describes a monoclonal antibody which is specific to VEGF 121, and a hybridoma producing this antibody. The antibody is used in a method for measuring the amount of VEGF 121

Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hyeger (see R42607). The full-length coding sequences can be generated using PCR with human foetal vascular smooth muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                      This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2955). Y08278-Y08301 are human growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Growth factor; pharmaceutical

                                                                                                                                                                                                                                                                                                                                                             RESULT 11
                                                                                                                                                                                                                                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       compositions for therapeutic or diagnostic use, e.g. for stimulating angiogenesis or tissue repair or for immunomobulation, e.g. by stimulating endothelial cell proliferation or inhibiting dendritic cell differentiation. Nucleic acids encoding the polypeptide can be used in pharmaceutical compositions for DNA vaccination or gene therapy. This sequence represents a protein fragment of a parapox virus D1701 vascular endothelial growth factor (VEGF) homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel polypeptide that is a parapox virus homolog of human vascular endothelial growth factor (PPV-VEGF) and stimulates endothelial cell proliferation. The products of the invention have angiogenic activity. The polypeptide can be used in pharmaceutical

CC encodes a heparin binding growth factor, HepGF (e.g. VEGF, FGF, HEBGF).

CC a protein synthesis inhibitor and opt. a linker imparting flexibility.

CC an antisense DNA sequence or an inhibitor of elongation factor?, to a cell carrying a HepGF receptor. The conjugates of the invention are conjugated to inhibit cell proliferation in cells carrying the particular cerestsive proliferation of principality. The exceptor and post a finite invention are conjugated to inhibit cell proliferation in cells carrying the particular cerestsive proliferation of epithelial cells, fibroblasts and crecurrence of pterygii after surgical removal, closure of trabeculectomy after glaucoma surgery and corneal clouding after cumours, restenosis, psoriasis, Dupuytren's contracture, diabetic complications, Kaposi's sarcoma and rheumatoid arthritis.

CC endothelial growth factors (WEGF). This sequence represent vascular CT These sequences; were used in VEGF conjugates of the invention. In the Conjugates, VEGF (or fragments of it) are linked to a targeted agent VEGF receptor. Cys-modified forms of VEGF are particularly suitable for C chemical conjugation to linkers and targeted agents. The conjugates are can be used for inhibiting proliferation of cells bearing VEGF receptors. They including dermatological disorders with underlying vascular proliferation, solid tumours or an ophthalmic disorder of vitreous humour. The conjugates can also be used for treating blood vessels of the retina, iris, conjunctiva or rheumatoid arthitis, skin cancers and other tumours, or varicose veins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents human vascular endothelial growth factor 121 (VEGF-121). VEGF stimulates production of nitric oxide and prostacyclin. VEGF can therefore be used for treatment or prevention of intimal hyperplasia in a blood vessel. VEGF can be used for treating or preventing any condition responsive to in vivo stimulation of nitric acid and prostacyclin (especially essential hypertension, pulmonary arterial hypertension (PAH), cor pulmonale and atherosclerosis. VEGF is specifically used to control (re)stenosis, where caused by PAH or by a surgical procedure such as angioplasty,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             encoding a Cytocoxin such as saporin. One or more linkers may join the Cytor. For the nucleat acid binding protein. These are selected to increase the specificity, toxicity, solubility, serum CX stability or intracellular availability, and may serve to promote condensation of nucleic acids for delivery to a cell. The fusion protein binds to FGFR and is internalised by cells that carry this receptor. The cytor. The function, gene expression and viability of cells. In particular, it may be used for the therapeutic alteration of the function, gene expression and prevention of cell proliferative disorders, correction, gene expression and prevention of cell proliferative disorders, the used for the treatment and prevention of cell proliferative disorders, cretinopathy, psyriasis and eczema. The gene delivery compositions of the invention have high specificity for particular cells and can deliver larger amounts of DNA compared to prior art methods. Sequences Al2853-Al2856 represent cDNA clones encoding vascular endothelial growth factor (MEGF), and sequences v90402-v90405 represent the encoded content and entered the content of the content and can be part and can be proved to the content and can be content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Loc

The gene delivery composition comprises a protein that binds the fibroblast growth factor receptor (FGFR) which is fuse chemically conjugated to a nucleic acid binding domain. The nucleic acid binding domain is complexed with a suitable expression construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel gene delivery composition for targetted delivery of cytotoxins or prodrug-converting enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gene delivery system, useful for treating or preventing cancer and rheumatoid arthritis, comprises receptor-internalized ligand linked
                                                                                                                                                                                                                                                                                                                                                                                    Amino acid sequence of vascular endothelial growth factor 121.
                                                                                                                                                                                                                                                                                                                                                                                                                                          03-JUL-2000 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Y69412 standard; Protein; 147 AA.

                                                                                                                         δÃ
                                                                                                                                                                                                                                                            The present sequence represents native human vascular endothelial growth CC factor (VEGF) 121. VEGF is an angiogenic factor. VEGF proteins are used for the prevention or repair of injury to blood vessels or associated CC and repair of vascular injury associated with microvascular angiopathy. CC particularly thrombotic microangiopathy. The proteins methods may also CC with injury to, or atrophy of, the vasculature of the glomerulus and CC syndrome, toxic shock syndrome, voxic shock syndrome, venom exposure, chemical exposure, CC hypercoagulable states, platelet activation or aggregation, thrombosis, intravascular coagulation, sepsis, pancreatis, acute renal failure, CC myocardial infarction, ischemic bowel disease, transient ischemic cattacks, stroke, hypoxia or hypercapnia or fibrosis arising from lung CC endothelium injury, acute respiratory distress syndrome, toxic alveolar cc cinjury, pneumonia, pulmonary emboli, birth prematurity disorders, cc cransplants, focal glomerulosclerosis, and amyloidosis.
